Notes to tables:

- (1) Voltage is with respect to GND.
- (2) The minimum DC input is -0.5 V. During transitions, the inputs may undershoot to -2.0 V or overshoot to +7.0 V for periods less than 20 ns under no-load conditions.
- (3) This parameter is under bias. Extended temperature versions are also available.
- (4) For all Clocks: t_R and t_F = 250 ns (maximum).
- (5) Operating conditions: T_A = 0° C to 70° C, V_{CC} = 5.0 V \pm 5% for commercial use.
 T_A = -40° C to 85° C, V_{CC} = 5.0 V \pm 10% for industrial use.
 T_C = -55° C to 125° C, V_{CC} = 5.0 V \pm 10% for military use.
- (6) Absolute values with respect to device GND; all over- and undershoots due to system or tester noise are included.
- (7) When the Turbo Bit is not set (non-turbo mode), device enters standby mode approximately 100 ns after the last input transition.
- (8) Measured with a device programmed as a 16-bit counter.
- (9) When the Turbo Bit is not set (non-turbo mode), the non-turbo adder values must be added to the appropriate AC parameter to determine worst-case timing.
- (10) The t_{PZX} and t_{PXZ} parameters are measured at ± 0.5 V from steady state voltage as driven by the output load specification; t_{PZX} is measured with C_L = 5 pF.
